Getting Help

Moneris has help for you at every stage of the integration process.

Getting Started	During Development	Production
Contact our Client Integration Specialists: clientintegrations@moneris.com	If you are already working with an integration specialist and need technical development assistance, contact our eProducts Technical Consultants: 1-866-319-7450	If your application is already live and you need production support, contact Moneris Customer Service: onlinepayments@moneris.com
		1-866-319-7450 Available 24/7
	eproducts@moneris.com	

For additional support resources, you can also make use of our community forums at http://community.moneris.com/product-forums/

Page 4 of 69 April 2020

System and Skills Requirements

In order to integrate with Moneris Checkout as a merchant, you must have:

• An e-commerce website with a back-end server

For development, you should have some understanding of the following:

- JavaScript
- JSON
- Server-side programming

Additionally, for Google Pay™ integration, all your front-end web pages must use the HTTPS protocol.

April 2020 Page 5 of 69

1 About Moneris Checkout

Moneris Checkout gives e-commerce merchants a simple and secure way to process payments by integrating a Moneris-hosted payment module into the merchant checkout page.

April 2020 Page 7 of 69

2 Building Your Moneris Checkout Integration

- 2.1 Configuring Moneris Checkout in Merchant Resource Center
- 2.2 Moneris Checkout Transaction Process Flow
- 2.3 Preparing Your Client-Side Checkout Page
- 2.4 Implementing Preload Server-to-Server Logic
- 2.5 Displaying the Moneris Checkout Page in the Browser
- 2.6 Handling Callbacks
- 2.7 Implementing Receipt Request Server-to-Server Logic
- 2.8 Terminating the Moneris Checkout Instance

2.1 Configuring Moneris Checkout in Merchant Resource Center

The first step is to configure your Moneris Checkout page in the Moneris Merchant Resource Center (MRC).

In the initial stage of development, you create a test configuration in the testing MRC. Once the solution is ready to be deployed to production, you must create a new, separate configuration for the production environment in the production MRC.

The **checkout ID** is the key value that is generated after the configuration is completed and used within the Preload Request in order to identify the specific Moneris Checkout configuration.

To get the checkout ID and start configuring your page, do the following:

- 1. Log into the Merchant Resource Center at one of the following URLs (according to your stage of development)
 - Testing: https://esqa.moneris.com/mpg

Production: https://www3.moneris.com/mpg

- 2. In the Admin menu, select Moneris Checkout Config
- 3. Click the Create Profile button
- 4. Follow the on-screen steps to complete the configuration

For more information, see the Merchant Resource Center documentation available for download on the Moneris developer portal at:

developer.moneris.com

April 2020 Page 8 of 69

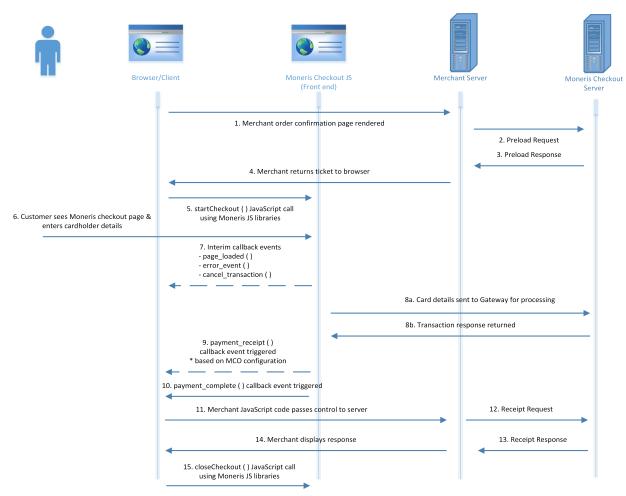

2.1.1 Additional Features to Configure in the MRC

There are other features of the Moneris Checkout page that you can enable using the configurator in the Merchant Resource Center. They include:

- Tokenization of credentials
- · Fraud tool behaviour
- · Window sizing

For more on configuring these features, see 3 Additional Features in Moneris Checkout.

2.2 Moneris Checkout Transaction Process Flow

Page 9 of 69 April 2020

2.3 Preparing Your Client-Side Checkout Page

In order to prepare your client-side checkout page for interacting with Moneris Checkout, you need to do a few tasks first:

1. Add a call to the Moneris Checkout JavaScript library in a <script> tag:

Testing:

```
<script src="https://gatewayt.moneris.com/chkt/js/chkt_
v1.00.js"></script>
Production:
```

```
<script src="https://gateway.moneris.com/chkt/js/chkt_v1.00.js"></script>
```

2. Create a <div> in the HTML:

```
<div id="monerisCheckout"></div>
```

a. (optional): If you are not using the "Full screen" window sizing option, you will need to define the size of your window by creating another <div> around this one, for example:

```
<div id="outerDiv" style="width:400px"; height"300px">
<div id="monerisCheckout"></div>
</div>
```

3. Instantiate the monerisCheckout object and set it up:

```
var myCheckout = new monerisCheckout();
myCheckout.setMode("qa");
myCheckout.setCheckoutDiv("monerisCheckout");
```

4. Set callbacks in JavaScript:

```
myCheckout.setCallback("page_loaded",myPageLoad);
myCheckout.setCallback("cancel_transaction",myCancelTransaction);
myCheckout.setCallback("error_event",myErrorEvent);
myCheckout.setCallback("payment_receipt",myPaymentReceipt);
myCheckout.setCallback("payment_complete",myPaymentComplete);
```

For more information about callbacks in Moneris Checkout, see 2.6 Handling Callbacks.

April 2020 Page 10 of 69

2.4 Implementing Preload Server-to-Server Logic

The Preload request is the means by which a Moneris Checkout instance is securely generated at transaction time. It involves a server-to-server post using the JSON format documented in 2.4.1 Preload Request .

The response to the Preload request returns a ticket number which uniquely identifies the instance and must be passed in the JavaScript monerisCheckout.startCheckout (ticket #) request in order to display the Moneris Checkout page in the browser.

In your server implementation, use the following Moneris Checkout URLs to post to, depending on the development stage:

Testing:

https://gatewayt.moneris.com/chkt/request/request.php

Production:

https://gateway.moneris.com/chkt/request/request.php

2.4.1 Preload Request

Transaction requests are sent to the Moneris Checkout server using JSON.

JSON structure overview for Preload request

```
{+}
-recur {+}
-cart {+}
-items [{+}]
-tax {+}
-contact_details {+}
-shipping_details {+}
-billing_details {+}
```

Request fields for Preload request - Required

Variable Name	Type and Limits	Description
<pre>store ID store_id</pre>	String N/A	Unique identifier provided by Moneris upon merchant account setup

Page 11 of 69 April 2020

Variable Name	Type and Limits	Description
APItoken api_token	String N/A	Unique alphanumeric string assigned upon merchant account activation
<pre>checkout ID checkout_id</pre>	String 30-character alphanumeric	Identifies your Moneris Checkout configuration; this is given to you when you configure your page in the Merchant Resource Center
transaction total amount txn_total	String 10-character decimal Up to 7 digits (dollars) + decimal point (.) + 2 digits (cents) after the decimal point EXAMPLE: 1234567.89	The total dollar amount of the transaction
developmental mode environment	String alphabetic	Indicates the stage of development you are sending the request for: testing = qa production = prod
request type action	String alphabetic	Type of request being made to Moneris Checkout server Allowable values: preload or receipt

Request fields for Preload request – Optional

Variable Name	Type and Limits	Description
order_no	String 30-character alphanumeric	The order number is a unique identifier appended to every financial transaction
<pre>customerID cust_id</pre>	String 30-character alphanumeric	Merchant-defined field that can be used as an identifier Searchable from the Moneris Merchant Resource Center

April 2020 Page 12 of 69

Variable Name	Type and Limits	Description
<pre>dynamic descriptor dynamic_descriptor</pre>	max 20-character alphanumeric total of 22 characters including your merchant name and separator	Merchant-defined description sent on a per-transaction basis that will appear on the credit card statement appended to the merchant's business name Dependent on the card issuer, the statement will typically show the dynamic descriptor appended to the merchant's existing business name separated by the "/" character; additional characters will be truncated NOTE: The 22-character maximum limit must take the "/" into account as one of the characters
language language	String 2-character alphabetic	Determines which language Moneris Checkout will display information in Allowable values: en – English fr – French

Additional request objects in Preload request – Optional

Variable Name	Type and Limits	Description
Recurring Billing	Object N/A	Contains fields related to Recurring Billing
Shopping Cart	Object N/A	The virtual shopping cart and its contents
Contact Details contact_details	Object N/A	Customer contact information This object is returned in the Response to Receipt Request as the Customer Information response object (cust_info)

Page 13 of 69 April 2020

Variable Name	Type and Limits	Description
Shipping Details shipping_details	Object N/A	Customer shipping information
Billing Details billing_details	Object N/A	Customer billing information

2.4.1.1 Optional Preload Request Objects

Moneris Checkout also allows you to send optional objects in the Preload request that reflect additional information entered by the customer at checkout, enable additional features, or meet transaction processing requirements.

If you have configured Moneris Checkout to handle these additional items, you do not send the corresponding object in the Preload request. Only send these optional objects if you are using your own ecommerce page to collect them separately from Moneris Checkout.

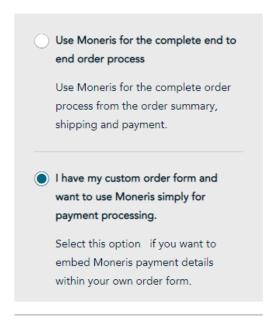

Optional objects you can use include:

- Recurring Billing Object
- Shopping Cart Object
- Contact Details Object
- Shipping Details Object
- Billing Details Object

The following screenshot shows what you select in the Merchant Resource Center if you are collecting additional items on your own e-commerce page:

April 2020 Page 14 of 69

Checkout Type

Recurring Billing Object

Optional object

Include this object in Preload request to indicate the start of a series of Recurring Billing transactions that will be managed by Moneris.

Top level object field

recur

Request fields for Recurring Billing object

Variable Name	Type and Limits	Description
<pre>number of recurs number_of_recurs</pre>	String numeric 1-99	The number of times that the transaction must recur
<pre>period recur_period</pre>	String numeric 1-999	Number of recur unit intervals that must pass between recurring billings
recurring amount recur_amount	String 10-character decimal, min-	Dollar amount of the recurring transaction

Page 15 of 69 April 2020

Variable Name	Type and Limits	Description
	imum three digits Up to 7 digits (dollars) + decimal point (.) + 2 digits (cents) after the decimal point EXAMPLE: 1234567.89	This amount will be billed on the start date, and then billed repeatedly based on the interval defined by period and recur unit
recur unit recur_unit	String day, week, month or eom	Unit to be used as a basis for the interval Works in conjunction with the period variable to define the billing frequency
<pre>start date start_date</pre>	String YYMMDD format	Date of the first future recurring billing transaction; this must be a date in the future If an additional charge will be made immediately, the start now variable must be set to true
<pre>bill now bill_now</pre>	String true or false	Set to true if a charge will be made against the card immediately; otherwise set to false

Shopping Cart Object

Optional object

The shopping cart object can contain multiple items (each item is represented as its own array within the Shopping Cart object).

Top level object field

cart

Request fields for Shopping Cart object

Variable Name	Type and Limits	Description
shopping cart items	Object	Encapsulates the entire array of items
items	sub-object containing	in the shopping cart

April 2020 Page 16 of 69

Variable Name	Type and Limits	Description
	arrays, nested within cart contains following items in blue	
item URL	String alphanumeric	URL that corresponds to the image of the Moneris Checkout shopping cart item
<pre>item description items.description</pre>	String alphanumeric	Describes the item in the shopping cart
<pre>item product code items.product_code</pre>	String 20-character alphanumeric	The SKU for the item
<pre>item unit cost items.unit_cost</pre>	String 10-character decimal Up to 7 digits (dollars) + decimal point (.) + 2 digits (cents) after the decimal point EXAMPLE: 1234567.89	Per-unit cost of the item
item quantity items.quantity	String numeric 6 characters maximum	Number of individual instances of the given item in the shopping cart
subtotal subtotal	String 10-character decimal Up to 7 digits (dollars) + decimal point (.) + 2 digits (cents) after the decimal point EXAMPLE: 1234567.89	Total dollar amount of the shopping cart, before taxes
tax tax	Object sub-object nested within	Contains information related to taxes charged on the items in the shopping cart

Page 17 of 69 April 2020

Variable Name	Type and Limits	Description
	cart contains following items in blue	
tax amount tax.amount	String 10-character decimal Up to 7 digits (dollars) + decimal point (.) + 2 digits (cents) after the decimal point EXAMPLE: 1234567.89	Dollar amount of taxes
tax description tax.description	String alphanumeric	Describes type of tax being applied
tax.rate	String Must be a number with up to 3 decimal places EXAMPLE: xx or xx.x or xx.xx or xx.xxx	Percentage tax rate charged

Contact Details Object

Optional object

Top level object field

contact_details

Request fields for Contact Details object

Variable Name	Type and Limits	Description
<pre>first name first_name</pre>	String 30-character alphanumeric	Customer first name
last name	String	Customer last name

April 2020 Page 18 of 69

Variable Name	Type and Limits	Description
last_name	30-character alphanumeric	
email email	String 255-character alphanumeric	Customer email
phone number phone	String 30-character alphanumeric	Customer phone number

Shipping Details Object

Optional object

Top level object field

shipping_details

Request fields for Shipping Details object

Variable Name	Type and Limits	Description
shipping address line 1	String	Customer shipping address
address_1	50-character alphanumeric	
shipping address line 2	String	Customer shipping address
address_2	50-character alphanumeric	
shipping city	String	Customer shipping address city
city	30-character alphanumeric	
shipping province	String	Customer shipping address province
province	30-character alphanumeric	
shipping city	String	Customer shipping address city
country	30-character alphanumeric	
shipping postal code	String	Customer shipping address postal
postal code	30-character alphanumeric	code

Page 19 of 69 April 2020

Billing Details Object

Optional object

Top level field

billing_details

Request fields for Billing Details object

Variable Name	Type and Limits	Description
billing address line 1	String	Customer billing address
address_1	50 character alphanumeric	
billing address line 2	String	Customer billing address
address_2	50 character alphanumeric	
billing city	String	Customer billing address city
city	30-character alphanumeric	
billing province	String	Customer billing address province
province	30-character alphanumeric	
billing country	String	Customer billing address country
country	2-character alphabetic	
billing postal code	String	Customer billing address postal code
postal code	30-character alphanumeric	

2.4.1.2 Example Preload Request JSON

This example reflects a Preload request with all optional objects.

```

2.4.2 Response to Preload Request

Response Fields – Response to Preload Request

Variable Name	Description
<pre>response "response":{</pre>	Top level response object
success":	Denotes whether the Preload request was successful
<pre>ticket "ticket":</pre>	Identifies the specific Moneris Checkout instance Only returned if success = true
<pre>error "error":{</pre>	Sub-object that encapsulates all errors that occurred as a result of the Preload request Only returned if success = false
data "data":	Describes the specific type of error that occurred as a result of some aspect of the Preload request

2.4.2.1 Example Preload Response – Successful Preload

```
"response":{
    "success":""true"",
    "ticket":"1585G9G9GIKKGGGIGIOG09G9OGKGJFKFJFNjuit8g9"
}
```

2.4.2.2 Example Preload Response – Failed Preload

```
"response":{
    "success":""false"",
    "error":{
        "billing_details":{
            "data":""billing address must be set when AVS is enabled""
```

Page 23 of 69 April 2020

```
}
}
}
```

2.5 Displaying the Moneris Checkout Page in the Browser

When a customer goes to check out their items for purchase, the Moneris Checkout page is displayed in the <div> tag you created on your web site

To insert the Moneris Checkout instance into the <div>, you call the JavaScript function:

```
monerisCheckout.startCheckout([ticket #])
```

2.6 Handling Callbacks

Callbacks are the means by which Moneris Checkout communicates with your merchant checkout page. All callbacks include a single parameter defined as a JSON-formatted string.

In order to handle callbacks, you need to create JavaScript functions that receive the callbacks being sent by Moneris Checkout when the events occur. These are the functions being referred to as part of the callback set methods, as described in 2.3 Preparing Your Client-Side Checkout Page.

2.6.1 Callback Types

These callbacks are required to be included in the JavaScript of your page:

- Page Loaded
- Cancel Transaction
- Error Event
- Payment Receipt
- Payment Complete

2.6.1.1 Callback Response Fields

Variable Name	Type and Limits	Description
handler	String	Describes the type of callback being
handler	alphanumeric	used

April 2020 Page 24 of 69

Variable Name	Type and Limits	Description
		Possible values:
		cancel_transaction
		error_event
		page_loaded
		payment_complete
		payment_receipt
ticket ticket	String	Identifies the specific Moneris Checkout instance
CICKEC	alphanumeric	This is also returned in the response to the original Preload
response code	String	Identifies the result of the callback
response_code	alphanumeric	For information on response codes, see Callback Response Codes – Mon- eris Checkout

2.6.1.2 Page Loaded

Callback Use

To get the page loaded status of the Moneris Checkout page.

This callback is called once the Moneris Checkout is loaded.

JavaScript Set Method for Callback

```
myCheckout.setCallback("page loaded", myPageLoad);
```

JSON Response Message Format

```
{
    "handler":"page_loaded",
    "ticket":"1539961059DdrvGG3Yj7rxvMAgvRlc4nqKXF7YjT",
    "response_code":"001"
}
```

Page 25 of 69 April 2020

2.6.1.3 Cancel Transaction

Callback Use

This callback is called in the event the cardholder presses the cancel button in Moneris Checkout.

Standard is to call the closeCheckout () method to close the Moneris Checkout <div>.

The closeCheckout () method will need to be called and a new Preload request will be required in order to initiate a new Moneris Checkout instance.

JavaScript Set Method for Callback

```
myCheckout.setCallback("cancel transaction", myCancelTransaction);
```

JSON Response Message Format

```
"handler":"cancel_transaction",
   "ticket":"1539961059DdrvGG3Yj7rxvMAgvRlc4nqKXF7YjT",
   "response_code":"001"
}
```

2.6.1.4 Error Event

Callback Use

When an error occurs during the checkout process. This requires the Moneris Checkout session to be closed using the closeCheckout function

To attempt the transaction again, a new Preload request must be sent to the Moneris Checkout server in order to get a new transaction ticket number.

JavaScript Set Method for Callback

```
myCheckout.setCallback("error event", myErrorEvent);
```

JSON Response Message Format

```
"handler":"error_event",
   "ticket":"1539961059DdrvGG3Yj7rxvMAgvRlc4nqKXF7YjT",
   "response_code":"902"
}
```

April 2020 Page 26 of 69

2.6.1.5 Payment Receipt

Callback Use

Transaction is complete and receipt is ready to be collected.

If you have chosen to have Moneris Checkout generate the receipt, this callback is called once the Moneris Checkout displays the transaction receipt.

JavaScript Set Method for Callback

```
myCheckout.setCallback("payment receipt", myPaymentReceipt);
```

JSON Response Message Format

```
"handler": "payment_receipt",
   "ticket": "1539961059DdrvGG3Yj7rxvMAgvRlc4nqKXF7YjT",
   "response_code": "001"
}
```

2.6.1.6 Payment Complete

Callback Use

This callback is called once Moneris Checkout has completed payment.

Moneris Checkout should be closed by calling the closeCheckout () method

JavaScript Set Method for Callback

```
myCheckout.setCallback("payment complete", myPaymentComplete);
```

JSON Response Message Format

```
"handler":"payment_complete",
   "ticket":"1539961059DdrvGG3Yj7rxvMAgvRlc4nqKXF7YjT",
   "response_code":"001"
}
```

2.7 Implementing Receipt Request Server-to-Server Logic

Once the Payment Complete callback has been called, your merchant website can make the server-to-server Receipt Request call in order to obtain the details of the transaction for the receipt and to determine whether the transaction was approved or declined.

Page 27 of 69 April 2020

In your server implementation, use the following Moneris Checkout URLs to post to, depending on the development stage:

Testing:

https://gatewayt.moneris.com/chkt/request/request.php

Production:

https://gateway.moneris.com/chkt/request/request.php

2.7.1 Receipt Request

Once the transaction is finished, you can request the receipt details from the Moneris Checkout server.

Request fields for Receipt Request – Required

Variable Name	Type and Limits	Description
<pre>store ID store_id</pre>	String N/A	Unique identifier provided by Moneris upon merchant account set up
API token api_token	String N/A	Unique alphanumeric string assigned upon merchant account activation
<pre>checkout ID checkout_id</pre>	String 30-character alphanumeric (maximum)	Identifies your Moneris Checkout configuration; this is given to you when you configure your page in the Merchant Resource Center
ticket number	String maximum 50-character alphanumeric	The unique ticket number that identifies a particular transaction; this returned in the response to the Preload request
developmental mode environment	String alphabetic	Indicates the stage of development you are sending the request for: testing = qa production = prod
request type action	String alphabetic	Type of request being made to Moneris Checkout server Allowable values: preload or receipt

April 2020 Page 28 of 69

2.7.1.1 Example Receipt Request JSON

```
"store_id":"example_storeId",
   "api_token":"example_apiToken",
   "checkout_id":"example_checkoutId",
   "ticket":"1539966660vfTyEASfnwNrsQqFE8VkMAOcN169zt",
   "environment":"qa",
   "action":"receipt"
}
```

2.7.2 Response to Receipt Request

Responses to Receipt Requests can contain multiple, nested response objects.

JSON structure for Response to Receipt Request

```
response {+}

request {+}

-cust_info {+}

-shipping {+}

-billing {+}

-cart {+}

-wallet {+}

-cc {+}

-gift [{+}]

receipt {+}

-gift [{+}]

-cc {+}

-dokenize {+}

-do
```

Page 29 of 69 April 2020

2.7.2.1 Definition of Response Fields – Response to Receipt Request

The following are fields that may be returned in the Response to Receipt Request, shown with nesting

Response Field Name and Key	Description
<pre>response {"response":{</pre>	Top level response object
success":	Denotes whether request was successful (i.e., approved, declined) Unsuccessful means error or could not process Possible values: true or false
request "request":{	Contains information relating to the Preload request and other information that Moneris Checkout sends to the Moneris Gateway when processing the financial transaction
<pre>transaction total amount "txn_total":</pre>	The total dollar amount of the transaction
<pre>Customer Information "cust_info":{</pre>	Customer contact information The information presented in this response object will reflect one of three scenarios: • If sent in the Preload request, this object will echo the Contact Details object • if Moneris Checkout is set to handle the customer contact information, it will reflect what the customer entered in the web form • If Moneris Checkout was set to not ask for this information, the response object will be empty
<pre>first name "first_name":</pre>	Customer first name

April 2020 Page 30 of 69

Response Field Name and Key	Description
<pre>last name "last_name":</pre>	Customer last name
<pre>phone number "phone":</pre>	Customer phone number
<pre>email "email":</pre>	Customer email
Shipping "shipping":{	Contains customer shipping information The information presented in this response object will reflect one of three scenarios: • If sent in the Preload request, this object will echo the Shipping Details object • if Moneris Checkout is set to handle the customer shipping information, it will reflect what the customer entered in the web form • If Moneris Checkout was set to not ask for this information, the response object will be empty
<pre>shipping address line 1 "address_1":</pre>	Customer shipping address
<pre>shipping address line 2 "address_2":</pre>	Customer shipping address
<pre>shipping city "city":</pre>	Customer shipping address city
<pre>shipping country "country":</pre>	Customer shipping address country
shipping province	Customer shipping address province

Page 31 of 69 April 2020

Response Field Name and Key	Description
"province":	
<pre>shipping postal code "postal_code":</pre>	Customer shipping address postal code
<pre>Billing "billing":{</pre>	Contains customer billing information The information presented in this response object will reflect one of three scenarios: • If sent in the Preload request, this object will echo the Billing Details object • if Moneris Checkout is set to handle the customer billing information, it will reflect what the customer entered in the web form • If Moneris Checkout was set to not ask for this information, the response object will be empty
billing address line 1 "address_1":	Customer billing address

<pre>digital wallet shipping address "shippingAddress": {</pre>	Object containing the cardholder's default shipping address information stored in the digital wallet
<pre>address 3 "address3":</pre>	Third line of the address
<pre>sorting code "sortingCode":</pre>	The sorting code
address 2 "address2":	Second line of the address
<pre>country code "countryCode":</pre>	ISO 3166-1 alpha-2 country code
<pre>address 1 "address1":</pre>	First line of the address
<pre>postal code "postalCode":</pre>	Address postal code or ZIP

Page 37 of 69 April 2020

Description
Name of the addressee
City, town, neighbourhood, or suburb
A country subdivision, such as a state or province
The unique ticket number that identifies a particular transaction; this returned in the response to the Preload request
Merchant-defined field that can be used as an identifier
Searchable from the Moneris Merchant Resource Center
Merchant-defined description sent on a per- transaction basis that will appear on the credit card statement appended to the mer- chant's business name
Dependent on the card issuer, the statement will typically show the dynamic descriptor appended to the merchant's existing business name separated by the "/" character; additional characters will be truncated
NOTE: The 22-character maximum limit must take the "/" into account as one of the characters
The order number is a unique identifier appended to every financial transaction
The e-commerce indicator or crypt type that was used to process the transaction
Possible values are:
5 - Authenticated e-commerce transaction (3-D Secure)
6 - Non-authenticated e-commerce transaction (3-D Secure)

April 2020 Page 38 of 69

Response Field Name and Key	Description
	7 - SSL-enabled merchant
<pre>Receipt "receipt":{</pre>	Object containing the receipt information
result (financial transaction) "result":	Indicates the result of the financial trans- action Possible values are: a = Accepted d = Declined
<pre>Gift (receipt) "gift":[{</pre>	Contains information related to gift card
<pre>order number "order_no":</pre>	The order number is a unique identifier appended to every financial transaction
<pre>transaction number "transaction_no":</pre>	Moneris Gateway-specific transaction identifier This field is required for any future follow-on transaction requests, such as Refund, Purchase Correction and Pre-Authorization Completion transactions
<pre>reference number "reference_no":</pre>	Terminal used to process the transaction, followed by the shift, batch and sequence number This data is typically used to reference transactions on the host systems, and must be displayed on any receipt presented to the customer This information should be stored by the merchant EXAMPLE Example: 660123450010690030 66012345: Terminal ID 001: Shift number 069: Batch number

Page 39 of 69 April 2020

Response Field Name and Key	Description
	003: Transaction number within the batch.
response code "response_code":	Transaction response code Possible values are: <50 – transaction approved >=50 –transaction declined NULL – transaction was not sent for authorization For more details on specific response, please see the Response Codes reference topic
<pre>benefit amount "benefit_amount":</pre>	This is the benefit that was generated for the transaction; the amount that was removed from the card as part of the transaction
<pre>benefit remaining "benefit_remaining":</pre>	The remaining balance on the gift card
<pre>first 6 last 4 "first6last4":</pre>	First 6 and last 4 digits of card number
Credit Card (receipt) "cc": {	Contains fields describing the response to the credit card transaction
<pre>order number "order_no":</pre>	The order number is a unique identifier appended to every financial transaction
<pre>customer ID "cust_id":</pre>	Merchant-defined field that can be used as an identifier Searchable from the Moneris Merchant Resource Center
<pre>transaction number "transaction_no";</pre>	Used to reference the original transaction when performing a follow-on transaction (i.e., Pre-Authorization Completion, Purchase Correction or Refund) This value is returned in the response of the original transaction

April 2020 Page 40 of 69

Response Field Name and Key	Description
	Pre-Authorization Completion: references a Pre-Authorization
	Refund/Purchase Correction: references a Purchase or Pre-Authorization Completion
<pre>reference number "reference_no":</pre>	Terminal used to process the transaction, followed by the shift, batch and sequence number
	This data is typically used to reference transactions on the host systems, and must be displayed on any receipt presented to the customer
	This information should be stored by the merchant
	EXAMPLE Example: 660123450010690030
	66012345: Terminal ID
	001: Shift number
	069: Batch number
	003: Transaction number within the batch.
<pre>transaction code "transaction code":</pre>	Type of financial transaction that was performed
	Possible values:
	00 – Purchase
	01 – Pre-Authorization
<pre>transaction type "transaction_type":</pre>	ISO transaction code for financial transaction
transaction date and time	Processing host date and time stamp
"transaction_date_time":	Format: YYYY-MM-DD HH:MM:SS
<pre>corporate card "corporateCard":</pre>	Indicates whether the payment card is a corporate card

Page 41 of 69 April 2020

Response Field Name and Key	Description
<pre>credit card amount "amount":</pre>	The total dollar amount that was charged to the credit card
<pre>response code "response_code":</pre>	Transaction response code Possible values are: <50 – transaction approved >=50 –transaction declined NULL – transaction was not sent for authorization For more details on specific response, please see the Response Codes reference topic
<pre>ISO response code "iso_response_code":</pre>	ISO response code returned from issuing institution For more details on specific ISO codes returned, see the Response Codes reference topic
<pre>approval code "approval_code":</pre>	Authorization code returned from the issuing institution
<pre>card type "card_type":</pre>	Type of payment card used to process the transaction Allowable values: V = Visa M = Mastercard AX = American Express DC = Diner's Card NO = Novus/Discover SE = Sears D = INTERAC® Debit C1 = JCB
wallet type	Type of digital wallet used in this transaction

April 2020 Page 42 of 69

"wallet_type":

Response Field Name and Key	Description
<pre>dynamic descriptor "dynamic_descriptor":</pre>	Merchant-defined description sent on a per- transaction basis that will appear on the credit card statement appended to the mer- chant's business name
	Dependent on the card issuer, the statement will typically show the dynamic descriptor appended to the merchant's existing business name separated by the "/" character; additional characters will be truncated NOTE: The 22-character maximum limit must take the "/" into account as one of the characters
<pre>invoice number "invoice_number":</pre>	Identifies an invoice number associated with the transaction
<pre>customer code "customer_code":</pre>	User-defined identifier
electronic commerce indicator "eci":	The e-commerce indicator or crypt type that was used to process the transaction Possible values: 5 - Authenticated e-commerce transaction (3D-Secure) 6 - Non-authenticated e-commerce transaction (3D-Secure) 7 - SSL-enabled merchant
<pre>CVD result code "cvd_result_code":</pre>	Indicates the CVD validation result The first byte is the numeric CVD indicator sent in the request; the second byte is the response code Possible response codes are shown in the CVD Response Codes reference
AVS result code "avs_result_code":	Indicates the address verification result For a full list of possible response codes refer to the AVS Response Codes reference
<pre>first 6 last 4 "first6last4":</pre>	First 6 and last 4 digits of card number

Page 43 of 69 April 2020

Response Field Name and Key	Description
expiry date	Expiry date of the card
"expiry_date":	MMYY format
<pre>recur success "recur_success":</pre>	Indicates whether the recurring billing trans- action has been successfully set up for future billing
	Possible values: true or false
<pre>issuerID "issuer_id":</pre>	Unique identifier for the cardholder's stored credentials
_	Sent back in the response from the card brand when processing a Credential on File transaction
	If the cardholder's credentials are being stored for the first time, and the issuer ID was returned in the response, you must save the issuer ID on your system to use in subsequent Credential on File transactions (applies to merchant-initiated transactions only)
	The issuer ID must be saved to your systems when returned from Moneris Gateway in the response data, regardless if the value was received or not
	As a best practice, if the issuer ID is not returned and you received a value of NULL instead, store that value and send it in the subsequent transaction
<pre>ECR (electronic cash register) number "ecr_no":</pre>	Terminal ID/ECR Number from the request
<pre>batch number "batch_no":</pre>	Batch number; also presented as a component of the reference number
<pre>sequence number "sequence_no":</pre>	Transaction number within the batch; also presented as a component of reference number
<pre>result (financial transaction) "result":</pre>	Indicates the result of the financial transaction

April 2020 Page 44 of 69

Response Field Name and Key	Description
	Possible values are: a = Accepted d = Declined
<pre>Tokenize "tokenize":{</pre>	Contains information related to the token- ization of cardholder credentials
success (tokenize) "success":	Indicates whether the card was successfully tokenized Possible values: true or false
<pre>first 4 last 4 "first4last4":</pre>	The first 4 and last 4 digits of the card
data key "data_key":	Unique identifier for a Vault profile, and used in future Vault financial transactions to associate a transaction with that profile
tokenization status "status":	Specifies what type of failure, if any, occurred during the tokenization request Possible values: 001 = Successful creation of a temporary token 940 = Invalid profile id (on tokenization request) 941 = Error generating token 942 = Invalid Profile ID, or source URL 943 = Card data is invalid (not numeric, fails mod10, we will remove spaces) 944 = Invalid expiration date (mmyy, must be current month or in the future) 945 = Invalid CVD data (not 3-4 digits)
tokenization message "message":	Provides additional details about the success or failure of the tokenization
Fraud "fraud":{	Contains sub-objects that describe information related to fraud tool inquiries
CVD "cvd":{	Contains information related to the CVD fraud tool

Page 45 of 69 April 2020

Response Field Name and Key	Description
<pre>decision origin "decision_origin":</pre>	Possible values: Moneris or Merchant

2.8 Terminating the Moneris Checkout Instance

To terminate the Moneris Checkout instance, call monerisCheckout.closeCheckout(), for example:

myCheckout.closeCheckout([ticket #]);

Page 57 of 69 April 2020

3 Additional Features in Moneris Checkout

- 3.1 Tokenization of Credentials With Moneris Checkout
- 3.2 Fraud Tools in Moneris Checkout
- 3.3 Window Size in Moneris Checkout

3.1 Tokenization of Credentials With Moneris Checkout

You can configure Moneris Checkout to store a cardholder's credentials in the Moneris Vault and receive a token that represents those credentials for use in future transactions.

If you want to tokenize credentials in Moneris Checkout transactions, you select the **Tokenize Card** option in the Merchant Resource Center

For more information, see the Merchant Resource Center documentation available for download on the Moneris developer portal at:

developer.moneris.com

3.2 Fraud Tools in Moneris Checkout

- 3.2.1 About Fraud Tools in Moneris Checkout
- 3.2.2 Kount as a Fraud Tool in Moneris Checkout
- 3.2.3 Fraud Tools and Auto Decision-Making

3.2.1 About Fraud Tools in Moneris Checkout

Several tools to mitigate the risk of fraud are available for transactions in Moneris Checkout, including:

- AVS
- CVD
- 3-D Secure
- Kount

April 2020 Page 58 of 69

To select which of these tools to use when performing transactions with Moneris Checkout, go to your Moneris Checkout configurator in the Moneris Merchant Resource Center under the Payment Security section.

For more information, see the Merchant Resource Center documentation available for download on the Moneris developer portal at:

developer.moneris.com

NOTE: CVD is always enabled as a fraud tool and will be performed on each transaction request in Moneris Checkout, but you can choose whether Moneris will treat the CVD result as a mandatory or optional factor to approve or deny the transaction.

3.2.2 Kount as a Fraud Tool in Moneris Checkout

If you select Kount as a fraud tool in Moneris Checkout and your company has its own Enterprise service account from Kount, you will need to include your Kount Merchant ID, Kount API Key and Kount Website ID when you configure your Moneris Checkoutstore in the Merchant Resource Center.

If you are using Moneris's basic fraud service package and do not have your own Kount enterprise account, you do not require this information.

3.2.3 Fraud Tools and Auto Decision-Making

Moneris Checkout can be configured to automatically proceed with or deny transactions as a result of a risk assessment it makes based on the responses it receives from the selected fraud tools.

When you check the box for auto decision-making, you also can choose whether each fraud tool's analysis will be treated by Moneris as an optional or mandatory factor in the decision to approve or deny the transaction.

This information applies to all fraud tools with the following exception:

• 3-D Secure, which is always mandatory if enabled

3.3 Window Size in Moneris Checkout

You can customize the appearance of the Moneris Checkout window presented to the customer on their web browser, including how much of the browser window will be taken up by Moneris Checkout.

The default sizing behaviour of the Moneris Checkout window is full-screen, i.e., Moneris Checkout fills the entire web page. You can alter this behaviour to present the customer with a windowed view instead. If you do not use the full-screen option, you must define the size of the <div> for the window ed view. For more information, see 2.3 Preparing Your Client-Side Checkout Page.

Page 59 of 69 April 2020

You configure the sizing along with other aspects of the Moneris Checkout window in the Merchant Resource Center.

April 2020 Page 60 of 69

4 Testing Your Moneris Checkout Integration

In the testing stage of development:

- 1. Use the testing Merchant Resource Center at https://esqa.moneris.com/mpg to configure your Moneris Checkout page for testing purposes
- 2. Use the testing URL for server to server requests:

```
https://gatewayt.moneris.com/chkt/request/request.php
```

3. Reference the testing JavaScript library:

```
<script src="https://gatewayt.moneris.com/chkt/js/chkt_
v1.00.js"></script>
```

4. Set your monerisCheckout object to the testing mode:

```
myCheckout.setMode("qa");
```

- 5. In all Preload requests use the value "qa" for the environment variable
- 6. In all Preload requests, make sure that you are using the testing version of your credentials for store ID, API token and checkout ID
- 7. In all Receipt requests use the value "qa" for the environment variable
- 8. In all Receipt requests, make sure that you are using the testing version of your credentials for store ID, API token and checkout ID

April 2020 Page 61 of 69

5 Moving to Production with Moneris Checkout

Once you have finished testing your Moneris Checkout integration, do the following to move the integration into production:

- 1. Ensure that you have duplicated your final testing configuration in your Moneris Checkout production configuration in the production Merchant Resource Center at https://esqa.moneris.com/mpg to configure your Moneris Checkout page for testing purposes
- 2. Use the production URL for server to server requests: https://gateway.moneris.com/chkt/request/request.php
- Set your monerisCheckout object to the production mode: myCheckout.setMode("prod");
- 5. In all Preload requests use the value "prod" for the environment variable
- 6. In all Preload requests, make sure that you are using the production version of your credentials for store ID, API token and checkout ID
- 7. In all Receipt requests use the value "prod" for the environment variable
- 8. In all Receipt requests, make sure that you are using the production version of your credentials for store ID, API token and checkout ID

6 Reference

- 6.1 Callback Response Codes Moneris Checkout
- 6.2 AVS Response Codes Moneris Checkout
- 6.3 CVD Response Codes Moneris Checkout
- 6.4 CAVV Result Codes

6.1 Callback Response Codes – Moneris Checkout

Response Code	Reason
001	Success
902	3-D Secure failed on response
2001	Invalid ticket/ticket re-use

6.2 AVS Response Codes – Moneris Checkout

Code	Visa	Mastercard/Discover	American Express/ JCB
Α	Street address matches, zip/postal code does not; acquirer rights not implied	Address matches, zip/ postal code does not	Billing address matches, zip/postal code does not
В	Street address matches; zip/postal code not verified due to incompatible formats	N/A	N/A
	(acquirer sent both street address and zip/postal code)		
С	Street address not verified due to incompatible formats	N/A	N/A
	(acquirer sent both street address and zip/postal code)		

April 2020 Page 63 of 69

Code	Visa	Mastercard/Discover	American Express/ JCB
D	Street address and zip/- postal code match	N/A	Customer name incorrect; zip/postal code matches
Е	N/A	N/A	Customer name incorrect, billing address and zip/-postal code match
F	Applies to UK only: Street address and zip/postal code match	N/A	Customer name incorrect; billing address matches
G	Address information not verified for international transaction Any of following may be true: • Issuer is not an AVS participant, or • AVS data was present in the request but issuer did not return an AVS result, or • Visa performs AVS on behalf of the issuer and there was no address record on file for this account	N/A	N/A
1	Address information not verified	N/A	N/A
K	N/A	N/A	Customer name matches
L	N/A	N/A	Customer name and zip/- postal code match
М	Street address and zip/-	N/A	Customer name, billing

Page 64 of 69 April 2020

Code	Visa	Mastercard/Discover	American Express/ JCB
	postal code match		address, and zip/postal code match
N	 No match; acquirer sent: postal/ZIP code only, or street address only, or both postal code and street address Also used when acquirer requests AVS but sends no AVS data	Neither address nor zip/- postal code matches	Billing address and zip/- postal code do not match
0	N/A	N/A	Customer name and billing address match
Р	Zip/postal code match; acquirer sent both zip/- postal code and street address, but street address not verified due to incom- patible formats	N/A	N/A
R	Retry; system unavailable or timed out Issuer ordinarily performs AVS, but was unavailable NOTE: Code R is used by Visa when issuers are unavailable; issuers should refrain from using this code.	Retry; system unable to process	System unavailable; retry
S	N/A	AVS currently not sup- ported	AVS currently not sup- ported
Т	N/A	Nine-digit zip code matches; address does not match	N/A

April 2020 Page 65 of 69

Code	Visa	Mastercard/Discover	American Express/ JCB
U	Address not verified for domestic transaction, for any of the following reasons:	No data from issuer- /authorization system	Information is unavailable
	 Issuer is not an AVS participant, or 		
	 AVS data was present in the request but issuer did not return an AVS result, or 		
	 Visa performs AVS on behalf of the issuer and there was no address record on file for this account 		
W	Not applicable; if present, replaced with Z by Visa Available for U.S. issuers	For U.S. addresses, nine- digit postal code matches, address does not	Customer name, billing address, and zip/postal code are all correct
	only	For addresses outside the U.S., postal code matches, address does not	matches
X	N/A	For U.S. addresses, nine- digit postal code and address match	N/A
		For addresses outside the U.S., postal code and address match	
Υ	Street address and zip/- postal code match	Billing address and zip/- postal code both match	Billing address and zip/- postal code both match
Z	Zip/postal code matches; street address does not match, or street address not included in request	For U.S. addresses, five- digit zip code matches, address does not match	Zip/postal code matches, billing address does not

Page 66 of 69 April 2020

6.3 CVD Response Codes - Moneris Checkout

CVD verification is available for Visa, Mastercard, Discover, American Express, JCB and UnionPay transactions.

Code	Description
M	Match
N	No match
Р	Not processed
S	CVD should be on the card, but Merchant has indicated that CVD is not present
U	Issuer is not a CVD participant
Υ	Match for American Express/JCB only
D	Invalid security code for American Express or JCB only
Other	Invalid response code

6.4 CAVV Result Codes

The Cardholder Authentication Verification Value (CAVV), the Accountholder Authentication Value (AAV), and the American Express Verification Value (AEVV), are the values that allows Visa, Mastercard and American Express to validate the integrity of the Visa Secure, Mastercard Identity Check and American Express SafeKey transaction data. These values are passed back from the issuer to the merchant after the authentication has taken place.

The merchant then integrates the CAVV/AAV/AEVV value into the authorization request using the Purchase with 3-D Secure or Pre-Authorization with 3-D Secure transaction type, described below:

- 1. Merchant conducts 3D-Secure authentication request and receives CAVV/AAV/AEVV value in response.
- 2. Merchant sends the CAVV/AAV/AEVV value to Moneris using the Purchase or Pre-Authorization with 3-D Secure transaction type and receives the CAVV result code in the response.

April 2020 Page 67 of 69

Visa CAVV result codes

Result Code	Message	Significance to Merchants
Blank	CAVV not present or not verified	Not a Visa Secure transaction. No liability shift and merchant is not protected from chargebacks
0	CAVV authentication results invalid	Not a Visa Secure transaction. No liability shift and merchant is not protected from chargebacks
1	CAVV failed validation (authentication)	Provided that you have implemented the Visa Secureprocess correctly, the liability for this transaction should remain with the Issuer for chargeback reason codes covered by Visa Secure.
2	CAVV passed validation (authentication)	Fully authenticated transaction. There is a liability shift and the merchant is protected from chargebacks.
3, 8, A	CAVV passed validation (attempt)	Visa Secure has been attempted. There is a liability shift and the merchant is protected from certain card fraud-related chargebacks.
4, 7, 9	CAVV failed validation (attempt)	Visa Secure has been attempted. There is a liability shift and the merchant is protected from certain card fraud-related chargebacks.
6	CAVV not validated - Issuer not participating	Visa Secure has been attempted. There is a liability shift and the merchant is protected from certain card fraud-related chargebacks.
В	CAVV passed validation; information only	Not a Visa Secure transaction. No liability shift and merchant is not protected from chargebacks
С	CAVV was not validated (attempt)	Visa Secure has been attempted. There is a liability shift and the merchant is protected from certain card fraud-related chargebacks.
D	CAVV was not validated (authentication)	Visa Secure has been attempted. There is a liability shift and the merchant is protected from certain card fraud-related chargebacks.

Mastercard CAVV result codes

Result Code	Message	Significance to Merchants
0	Authentication failed	Not a Mastercard Identity Check transaction. No liability shift and merchant is not protected from

Page 68 of 69 April 2020

Result Code	Message	Significance to Merchants
		chargebacks
1	Authentication attempted	Mastercard Identity Check has been attempted. There is a liability shift and the merchant is protected from certain card fraud-related chargebacks (international commercial cards excluded).
2	Authentication successful	Fully authenticated transaction. There is a liability shift and the merchant is protected from chargebacks.

American Express CAVV result codes

NOTE: American Express SafeKey is only available to American Express direct acquired merchants (i.e., not OptBlue merchants). Any questions pertaining to chargebacks, liability and disputes should be addressed to your American Express representative given that American Express is the acquirer of record for these merchants.

Result Code	Description
1	AEVV Failed - Authentication, Issuer Key
2	AEVV Passed - Authentication, Issuer Key
3	AEVV Passed - Attempt, Issuer Key
4	AEVV Failed - Attempt, Issuer Key
7	AEVV Failed - Attempt, Issuer not participating, Network Key
8	AEVV Passed - Attempt, Issuer not participating, Network Key
9	AEVV Failed - Attempt, Participating, Access Control Server (ACS) not available, Network Key
А	AEVV Passed - Attempt, Participating, Access Control Server (ACS) not available, Network Key
U	AEVV Unchecked
